Package 'reticulate'

February 14, 2018

Type Package

Title Interface to 'Python'

Version 1.5

Description Interface to 'Python' modules, classes, and functions. When calling into 'Python', R data types are automatically converted to their equivalent 'Python' types. When values are returned from 'Python' to R they are converted back to R types. Compatible with all versions of 'Python' >= 2.7.

License Apache License 2.0

R topics documented:

`array_reshape` *Reshape an Array*

Description

Reshape (reindex) a multi-dimensional array, using row-major (C-style) reshaping semantics by default.

Usage

```
array_reshape(x, dim, order = c("C", "F"))
```

Arguments

`x`	An array
`dim`	The new dimensions to be set on the array.
`order`	The order in which elements of `x` should be read during the rearrangement. `"C"` means elements should be read in row-major order, with the last index changing fastest; `"F"` means elements should be read in column-major order, with the first index changing fastest.

Details

This function differs from e.g. `dim(x) <- dim` in a very important way: by default, `array_reshape()` will fill the new dimensions in row-major (C-style) ordering, while `dim<-()` will fill new dimensions in column-major (Fortran-style) ordering. This is done to be consistent with libraries like NumPy, Keras, and TensorFlow, which default to this sort of ordering when reshaping arrays. See the examples for why this difference may be important.

Examples

```
## Not run:
# let's construct a 2x2 array from a vector of 4 elements
x <- 1:4

# rearrange will fill the array row-wise
array_reshape(x, c(2, 2))
#      [,1] [,2]
# [1,]    1    2
# [2,]    3    4
# setting the dimensions 'fills' the array col-wise
dim(x) <- c(2, 2)
x
#      [,1] [,2]
# [1,]    1    3
# [2,]    2    4

## End(Not run)
```

conda-tools *Interface to conda utility commands*

Description

Interface to conda utility commands

Usage

```
conda_list(conda = "auto")

conda_create(envname, packages = "python", conda = "auto")

conda_remove(envname, packages = NULL, conda = "auto")

conda_install(envname, packages, pip = FALSE, pip_ignore_installed = TRUE,
  conda = "auto")

conda_binary(conda = "auto")

conda_version(conda = "auto")
```

Arguments

conda	Path to conda executable (or "auto" to find conda using the PATH and other conventional install locations).
envname	Name of conda environment
packages	Character vector with package names to install.
pip	TRUE to use pip (defaults to FALSE)
pip_ignore_installed	Ignore installed versions when using pip. This is TRUE by default so that specific package versions can be installed even if they are downgrades. The FALSE option is useful for situations where you don't want a pip install to attempt an overwrite of a conda binary package (e.g. SciPy on Windows which is very difficult to install via pip due to compilation requirements).

Value

conda_list() returns a data frame with the names and paths to the respective python binaries of available environments. conda_create() returns the Path to the python binary of the created environment. conda_binary() returns the location of the main conda binary or NULL if none can be found.

dict *Create Python dictionary*

Description

Create a Python dictionary object, including a dictionary whose keys are other Python objects rather than character vectors.

Usage

```
dict(..., convert = FALSE)
```

Arguments

...	Name/value pairs for dictionary (or a single named list to be converted to a dictionary).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.

Value

A Python dictionary

Note

The returned dictionary will not automatically convert it's elements from Python to R. You can do manual converstion with the py_to_r() function or pass convert = TRUE to request automatic conversion.

eng_python *A reticulate Engine for Knitr*

Description

This provides a reticulate engine for knitr, suitable for usage when attempting to render Python chunks. Using this engine allows for shared state between Python chunks in a document – that is, variables defined by one Python chunk can be used by later Python chunks.

Usage

```
eng_python(options)
```

Arguments

options	Chunk options, as provided by knitr during chunk execution.

Details

The engine can be activated by setting (for example)

```
knitr::knit_engines$set(python = reticulate::eng_python)
```

Typically, this will be set within a document's setup chunk, or by the environment requesting that Python chunks be processed by this engine.

`import` *Import a Python module*

Description

Import the specified Python module for calling from R.

Usage

```
import(module, as = NULL, convert = TRUE, delay_load = FALSE)

import_main(convert = TRUE)

import_builtins(convert = TRUE)

import_from_path(module, path, convert = TRUE, delay_load = FALSE)
```

Arguments

`module`	Module name
`as`	Alias for module name (affects names of R classes)
`convert`	`TRUE` to automatically convert Python objects to their R equivalent. If you pass `FALSE` you can do manual conversion using the `py_to_r()` function.
`delay_load`	`TRUE` to delay loading the module until it is first used. `FALSE` to load the module immediately. If a function is provided then it will be called once the module is loaded. If a list containing `on_load()` and `on_error(e)` elements is provided then `on_load()` will be called on successful load and `on_error(e)` if an error occurs.
`path`	Path to import from

Details

The `import_from_path` function imports a Python module from an arbitrary filesystem path (the directory of the specified python script is automatically added to the `sys.path`).

Value

A Python module

Examples

```
## Not run:
main <- import_main()
sys <- import("sys")

## End(Not run)
```

`iterate` *Traverse a Python iterator or generator*

Description

Traverse a Python iterator or generator

Usage

```
iterate(it, f = base::identity, simplify = TRUE)

iter_next(it, completed = NULL)
```

Arguments

`it`	Python iterator or generator
`f`	Function to apply to each item. By default applies the `identity` function which just reflects back the value of the item.
`simplify`	Should the result be simplified to a vector if possible?
`completed`	Sentinel value to return from `iter_next()` if the iteration completes (defaults to `NULL` but can be any R value you specify).

Details

Simplification is only attempted all elements are length 1 vectors of type "character", "complex", "double", "integer", or "logical".

Value

For `iterate()`, A list or vector containing the results of calling `f` on each item in `x` (invisibly); For `iter_next()`, the next value in the iteration (or the sentinel `completed` value if the iteration is complete).

np_array *NumPy array*

Description

Create NumPy arrays and convert the data type and in-memory ordering of existing NumPy arrays.

Usage

```
np_array(data, dtype = NULL, order = "C")
```

Arguments

data	Vector or existing NumPy array providing data for the array
dtype	Numpy data type (e.g. "float32", "float64", etc.)
order	Memory ordering for array. "C" means C order, "F" means Fortran order.

Value

A NumPy array object.

py *Interact with the Python Main Module*

Description

The py object provides a means for interacting with the Python main session directly from R.

Usage

```
py
```

Format

An R object acting as an interface to the Python main module.

py_available *Check if Python is available on this system*

Description

Check if Python is available on this system

Usage

```
py_available(initialize = FALSE)

py_numpy_available(initialize = FALSE)
```

Arguments

initialize	TRUE to attempt to initialize Python bindings if they aren't yet available (defaults to FALSE).

Value

Logical indicating whether Python is initialized.

Note

The py_numpy_available function is a superset of the py_available function (it calls py_available first before checking for NumPy).

py_capture_output *Capture and return Python output*

Description

Capture and return Python output

Usage

```
py_capture_output(expr, type = c("stdout", "stderr"))
```

Arguments

expr	Expression to capture stdout for
type	Streams to capture (defaults to both stdout and stderr)

Value

Character vector with output

py_config *Python configuration*

Description

Information on Python and Numpy versions detected

Usage

```
py_config()
```

Value

Python configuration object; Logical indicating whether Python bindings are available

py_discover_config *Discover the version of Python to use with reticulate.*

Description

This function enables callers to check which versions of Python will be discovered on a system as well as which one will be chosen for use with reticulate.

Usage

```
py_discover_config(required_module = NULL, use_environment = NULL)
```

Arguments

`required_module`
: A optional module name that must be available in order for a version of Python to be used.

`use_environment`
: An optional virtual/conda environment name to prefer in the search

Value

Python configuration object.

py_function_wrapper *Scaffold R wrappers for Python functions*

Description

Scaffold R wrappers for Python functions

Usage

```
py_function_wrapper(python_function, r_prefix = NULL, r_function = NULL)

py_function_docs(python_function)
```

Arguments

python_function	Fully qualfied name of Python function or class constructor (e.g. `tf$layers$average_pooling1d`)
r_prefix	Prefix to add to generated R function name
r_function	Name of R function to generate (defaults to name of Python function if not specified)

Note

The generated wrapper will often require additional editing (e.g. to convert Python list literals in the docs to R lists, to massage R numeric values to Python integers via `as.integer` where required, etc.) so is really intended as an starting point for an R wrapper rather than a wrapper that can be used without modification.

py_get_attr *Get an attribute of a Python object*

Description

Get an attribute of a Python object

Usage

```
py_get_attr(x, name, silent = FALSE)
```

Arguments

x	Python object
name	Attribute name
silent	`TRUE` to return `NULL` if the attribute doesn't exist (default is `FALSE` which will raise an error)

Value

Attribute of Python object

`py_has_attr` *Check if a Python object has an attribute*

Description

Check whether a Python object `x` has an attribute `name`.

Usage

```
py_has_attr(x, name)
```

Arguments

`x`	A python object.
`name`	The attribute to be accessed.

Value

`TRUE` if the object has the attribute `name`, and `FALSE` otherwise.

`py_help` *Documentation for Python Objects*

Description

Documentation for Python Objects

Usage

```
py_help(object)
```

Arguments

`object`	Object to print documentation for

py_id *Unique identifer for Python object*

Description

Get a globally unique identifer for a Python object.

Usage

```
py_id(object)
```

Arguments

object	Python object

Value

Unique identifer (as integer) or NULL

Note

In the current implementation of CPython this is the memory address of the object.

py_is_null_xptr *Check if a Python object is a null externalptr*

Description

Check if a Python object is a null externalptr

Usage

```
py_is_null_xptr(x)

py_validate_xptr(x)
```

Arguments

x	Python object

Details

When Python objects are serialized within a persisted R environment (e.g. .RData file) they are deserialized into null externalptr objects (since the Python session they were originally connected to no longer exists). This function allows you to safely check whether whether a Python object is a null externalptr.

The py_validate function is a convenience function which calls py_is_null_xptr and throws an error in the case that the xptr is NULL.

Value

Logical indicating whether the object is a null externalptr

`py_iterator` *Create a Python iterator from an R function*

Description

Create a Python iterator from an R function

Usage

```
py_iterator(fn, completed = NULL)
```

Arguments

`fn`	R function with no arguments.
`completed`	Special sentinel return value which indicates that iteration is complete (defaults to `NULL`)

Details

Python generators are functions that implement the Python iterator protocol. In Python, values are returned using the `yield` keyword. In R, values are simply returned from the function.

In Python, the `yield` keyword enables successive iterations to use the state of previous iterations. In R, this can be done by returning a function that mutates it's enclosing environment via the `<<-` operator. For example:

```
sequence_generator <-function(start) {
  value <- start
  function() {
    value <<- value + 1
    value
  }
}

g <- generator(sequence_generator(10))
```

Value

Python iterator which calls the R function for each iteration.

Ending Iteration

In Python, returning from a function without calling `yield` indicates the end of the iteration. In R however, `return` is used to yield values, so the end of iteration is indicated by a special return value (`NULL` by default, however this can be changed using the `completed` parameter). For example:

```
sequence_generator <-function(start) {
  value <- start
  function() {
    value <<- value + 1
    if (value < 100)
      value
    else
      NULL
  }
}
```

Threading

Some Python APIs use generators to parallelize operations by calling the generator on a background thread and then consuming it's results on the foreground thread. The `py_iterator()` function creates threadsafe iterators by ensuring that the R function is always called on the main thread (to be compatible with R's single-threaded runtime) even if the generator is run on a background thread.

`py_last_error` *Get or clear the last Python error encountered*

Description

Get or clear the last Python error encountered

Usage

```
py_last_error()

py_clear_last_error()
```

Value

For `py_last_error()`, a list with the type, value, and traceback for the last Python error encountered (can be `NULL` if no error has yet been encountered).

py_len *Length of Python object*

Description

Get the length of a Python object (equivalent to the Python `len()` built in function).

Usage

```
py_len(x)
```

Arguments

x	Python object

Value

Length as integer

py_list_attributes *List all attributes of a Python object*

Description

List all attributes of a Python object

Usage

```
py_list_attributes(x)
```

Arguments

x	Python object

Value

Character vector of attributes

py_module_available *Check if a Python module is available on this system.*

Description

Check if a Python module is available on this system.

Usage

```
py_module_available(module)
```

Arguments

module	Name of module

Value

Logical indicating whether module is available

py_run *Run Python code*

Description

Execute code within the the __main__ Python module.

Usage

```
py_run_string(code, local = FALSE, convert = TRUE)

py_run_file(file, local = FALSE, convert = TRUE)

py_eval(code, convert = TRUE)
```

Arguments

code	Code to execute
local	Whether to create objects in a local/private namespace (if FALSE, objects are created within the main module).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.
file	Source file

Value

For py_eval(), the result of evaluating the expression; For py_run_string() and py_run_file(), the dictionary associated with the code execution.

py_save_object *Save and load Python objects with pickle*

Description

Save and load Python objects with pickle

Usage

```
py_save_object(object, filename, pickle = "pickle")

py_load_object(filename, pickle = "pickle")
```

Arguments

object	Object to save
filename	File name
pickle	The implementation of pickle to use (defaults to "pickle" but could e.g. also be "cPickle")

py_set_attr *Set an attribute of a Python object*

Description

Set an attribute of a Python object

Usage

```
py_set_attr(x, name, value)
```

Arguments

x	Python object
name	Attribute name
value	Attribute value

py_set_seed *Set Python and NumPy random seeds*

Description

Set various random seeds required to ensure reproducible results. The provided seed value will establish a new random seed for Python and NumPy, and will also (by default) disable hash randomization.

Usage

```
py_set_seed(seed, disable_hash_randomization = TRUE)
```

Arguments

seed	A single value, interpreted as an integer
disable_hash_randomization	Disable hash randomization, which is another common source of variable results. See https://docs.python.org/3.4/using/cmdline.html#envvar-PYTHONHASHSEED

Details

This function does not set the R random seed, for that you should call set.seed().

py_str *An S3 method for getting the string representation of a Python object*

Description

An S3 method for getting the string representation of a Python object

Usage

```
py_str(object, ...)
```

Arguments

object	Python object
...	Unused

Details

The default implementation will call PyObject_Str on the object.

Value

Character vector

py_suppress_warnings *Suppress Python warnings for an expression*

Description

Suppress Python warnings for an expression

Usage

```
py_suppress_warnings(expr)
```

Arguments

expr	Expression to suppress warnings for

Value

Result of evaluating expression

py_to_r_wrapper *R wrapper for Python objects*

Description

S3 method to create a custom R wrapper for a Python object. The default wrapper is either an R environment or an R function (for callable python objects).

Usage

```
py_to_r_wrapper(x)
```

Arguments

x	Python object

py_unicode *Convert to Python Unicode Object*

Description

Convert to Python Unicode Object

Usage

```
py_unicode(str)
```

Arguments

str	Single element character vector to convert

Details

By default R character vectors are converted to Python strings. In Python 3 these values are unicode objects however in Python 2 they are 8-bit string objects. This function enables you to obtain a Python unicode object from an R character vector when running under Python 2 (under Python 3 a standard Python string object is returend).

r-py-conversion *Convert between Pyton and R objects*

Description

Convert between Pyton and R objects

Usage

```
py_to_r(x)

r_to_py(x, convert = FALSE)
```

Arguments

x	Object to convert
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.

Value

Converted object

reticulate *R Interface to Python*

Description

R interface to Python modules, classes, and functions. When calling into Python R data types are automatically converted to their equivalent Python types. When values are returned from Python to R they are converted back to R types. The reticulate package is compatible with all versions of Python >= 2.7. Integration with NumPy requires NumPy version 1.6 or higher.

source_python *Read and evaluate a Python script*

Description

Evaluate a Python script and make created Python objects available within R.

Usage

```
source_python(file, envir = parent.frame(), convert = TRUE)
```

Arguments

file	Source file
envir	The environment to assign Python objects into (for example, parent.frame() or globalenv()). Specify NULL to not assign Python objects.
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.

tuple *Create Python tuple*

Description

Create a Python tuple object

Usage

```
tuple(..., convert = FALSE)
```

Arguments

...	Values for tuple (or a single list to be converted to a tuple).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.

Value

A Python tuple

Note

The returned tuple will not automatically convert it's elements from Python to R. You can do manual converstion with the py_to_r() function or pass convert = TRUE to request automatic conversion.

---

use_python *Configure which version of Python to use*

Description

Configure which version of Python to use

Usage

```
use_python(python, required = FALSE)

use_virtualenv(virtualenv, required = FALSE)

use_condaenv(condaenv, conda = "auto", required = FALSE)
```

Arguments

python	Path to Python binary
required	Is this version of Python required? If TRUE then an error occurs if it's not located. Otherwise, the version is taken as a hint only and scanning for other versions will still proceed.
virtualenv	Directory of Python virtualenv
condaenv	Name of Conda environment
conda	Conda executable. Default is "auto", which checks the PATH as well as other standard locations for Anaconda installations.

`with.python.builtin.object` *Evaluate an expression within a context.*

Description

The `with` method for objects of type `python.builtin.object` implements the context manager protocol used by the Python `with` statement. The passed object must implement the context manager (`__enter__` and `__exit__` methods.

Usage

```
## S3 method for class 'python.builtin.object'
with(data, expr, as = NULL, ...)
```

Arguments

`data`	Context to enter and exit
`expr`	Expression to evaluate within the context
`as`	Name of variable to assign context to for the duration of the expression's evaluation (optional).
`...`	Unused

Index
